Outline

Squeezed Light

- Dynamics
- Generation and Detection
- Application: Gravitation Wave

Dynamics

Motion in the quadrature plane
Light of a single frequency ω,

$$a(t) = a(0)e^{-i\omega t}$$
$$a^\dagger(t) = a^\dagger(0)e^{i\omega t}$$

The evolutions of the quadrature operators are

Dynamics

Motion in the quadrature plane
Light of a single frequency ω,

$$a(t) = a(0)\, e^{-i\omega t}$$
$$a^{\dagger}(t) = a^{\dagger}(0)\, e^{i\omega t}$$

The evolutions of the quadrature operators are

$$X(t) = X(0)\cos(\omega t + \phi)$$
$$Y(t) = Y(0)\sin(-\omega t + \phi)$$

Clockwise motion!

Dynamics

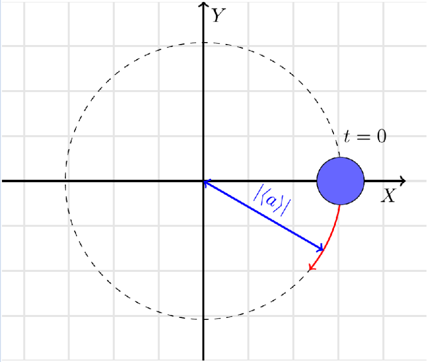
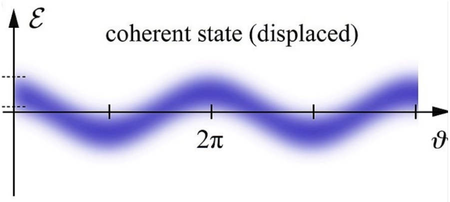
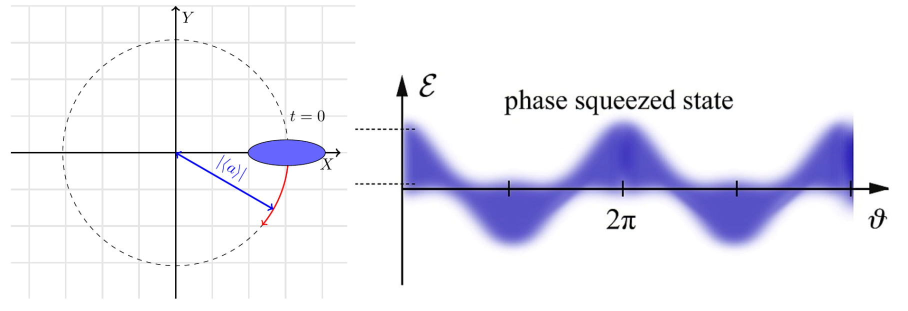
Coherent state

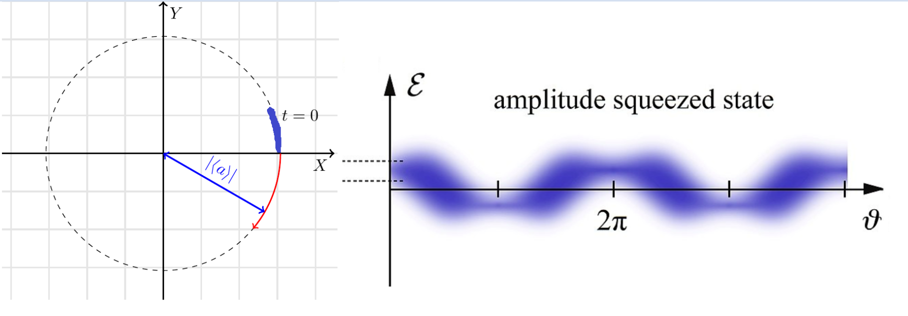




Phase squeezed state

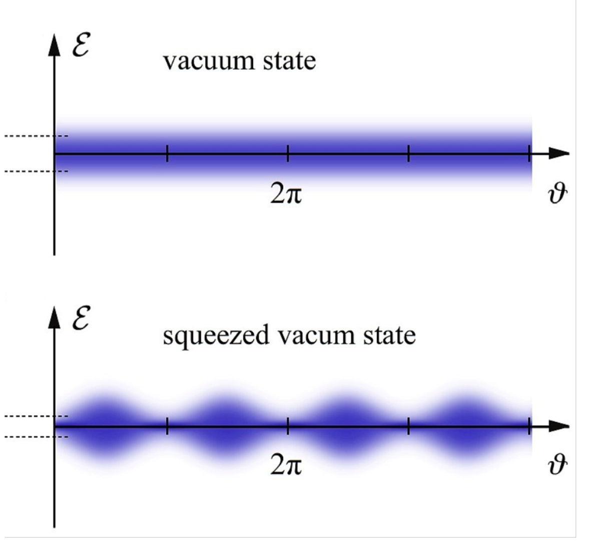


Amplitude squeezed state



Skecth the dynamics of a vacuum state and a squeezed vacuum state

Skecth the dynamics of a vacuum state and a squeezed vacuum state



Generation

Recall

Generation of a coherent state

Displacement operators $D(\alpha) = e^{\alpha a^\dagger - \alpha^* a}$ and $|\alpha\rangle = D(\alpha)|0\rangle$.
For a oscillating current source $\mathbf{J} = \mathbf{J}_0(\mathbf{r})e^{i\omega t}$, the interaction Hamiltonian becomes

$$\mathcal{H}_I = \left(V_I a + V_I^* a^\dagger \right),$$

where the interaction potenital is time-indepdenent and reads

$$V_I = i\omega \int dv \boldsymbol{\mathcal{E}}_\omega(\mathbf{r}) \cdot \mathbf{J}_0(\mathbf{r}).$$

The evolution of a state is given by

$$|\psi(t)\rangle_I = e^{\alpha^* a - \alpha a^\dagger}|0\rangle$$

Generation

Recall

Generation of a coherent state

Displacement operators $D(\alpha) = e^{\alpha a^\dagger - \alpha^* a}$ and $|\alpha\rangle = D(\alpha)|0\rangle$.
For a oscillating current source $\mathbf{J} = \mathbf{J}_0(\mathbf{r})e^{i\omega t}$, the interaction Hamiltonian becomes

$$\mathcal{H}_I = \left(V_I a + V_I^* a^\dagger \right),$$

where the interaction potenital is time-indepdenent and reads

$$V_I = i\omega \int dv \boldsymbol{\mathcal{E}}_\omega(\mathbf{r}) \cdot \mathbf{J}_0(\mathbf{r}).$$

The evolution of a state is given by

$$|\psi(t)\rangle_I = e^{\alpha^* a - \alpha a^\dagger}|0\rangle \qquad \alpha = \frac{iV_I^*}{\hbar}$$

Generation

Operator

A squeezed state is generated by a squeeze operator,

$$S(\xi) = \exp\left(\frac{\xi^* a^2 - \xi(a^\dagger)^2}{2}\right).$$

Generation

Operator

A squeezed state is generated by a squeeze operator,

$$S(\xi) = \exp\left(\frac{\xi^* a^2 - \xi(a^\dagger)^2}{2}\right).$$

Speculation

Because of a^2 and $(a^\dagger)^2$, we need terms of $\mathbf{E}^2$. **Squeezing involves nonlinear process!**

Generation

Operator

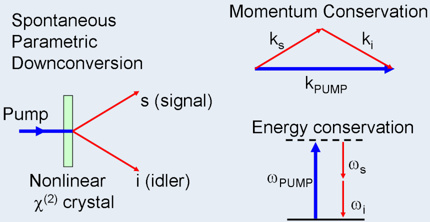
A squeezed state is generated by a squeeze operator,

$$S(\xi) = \exp\left(\frac{\xi^* a^2 - \xi (a^\dagger)^2}{2}\right).$$

Speculation

Because of a^2 and $(a^\dagger)^2$, we need terms of $\mathbf{E}^2$. **Squeezing involves nonlinear process!**

Spontaneous parametric down-conversion



Generation: Parametric Down-Conversion

$$\mathcal{H} = \hbar\omega a^* a + \hbar\omega_p \omega a_p^* a_p + i\hbar\beta\chi^{(2)} \left(a^2 a_p^\dagger - (a^\dagger)^2 a_p \right)$$

$\chi^{(2)}$: second order susceptibility
β: parameter related to the modes

Generation: Parametric Down-Conversion

$$\mathcal{H} = \hbar\omega a^* a + \hbar\omega_p \omega a_p^* a_p + i\hbar\beta\chi^{(2)}\left(a^2 a_p^\dagger - (a^\dagger)^2 a_p\right)$$

$\chi^{(2)}$: second order susceptibility
β: parameter related to the modes
Assume the pumping is a coherent state $|\alpha\rangle$

$$\mathcal{H} = \hbar\omega a^* a + i\hbar\beta\chi^{(2)}\left(\alpha^* a^2 - \alpha(a^\dagger)^2\right)$$

Generation: Parametric Down-Conversion

$$\mathcal{H} = \hbar\omega a^* a + \hbar\omega_p \omega a_p^* a_p + i\hbar\beta\chi^{(2)} \left(a^2 a_p^\dagger - (a^\dagger)^2 a_p \right)$$

$\chi^{(2)}$: second order susceptibility
β: parameter related to the modes
Assume the pumping is a coherent state $|\alpha\rangle$

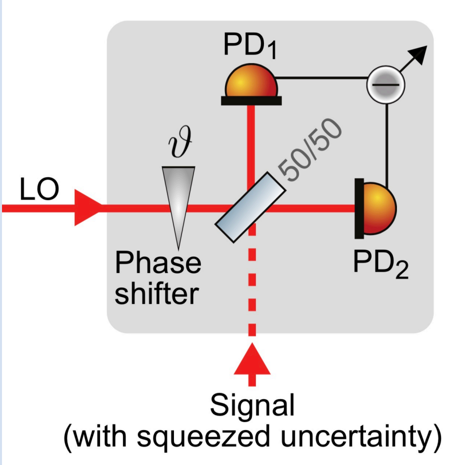
$$\mathcal{H} = \hbar\omega a^* a + i\hbar\beta\chi^{(2)} \left(\alpha^* a^2 - \alpha (a^\dagger)^2 \right)$$

Evolution operator is a squeeze operator!

$$U(t) = \exp\left[\eta^* t a^2 - \eta t (a^\dagger)^2 \right] = S(\xi)$$

Detection

balanced homodyne detector (BHD)
Local oscillator (LO): coherent state $|\alpha\rangle$

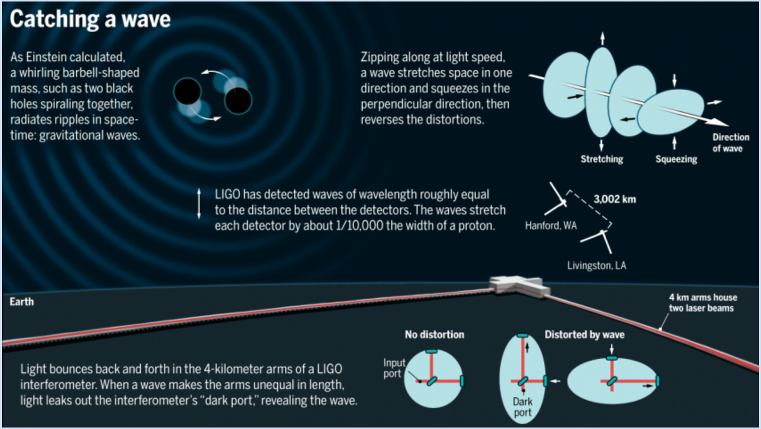


$$I_1 - I_2 = 2|\alpha|\langle X(\theta)\rangle$$

See Sec. 7.3 of C. Gerry and P. Knight

Gravitational Wave Detection

- General relativity: mass m distorts space-time; length varies
- Collision of giant masses (black holes) generates gravitational waves



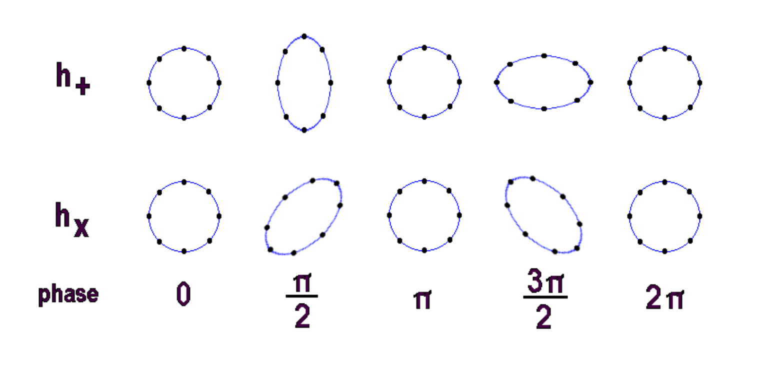
V. ALTOUNIAN/SCIENCE

Gravitational Wave Detection

Effects

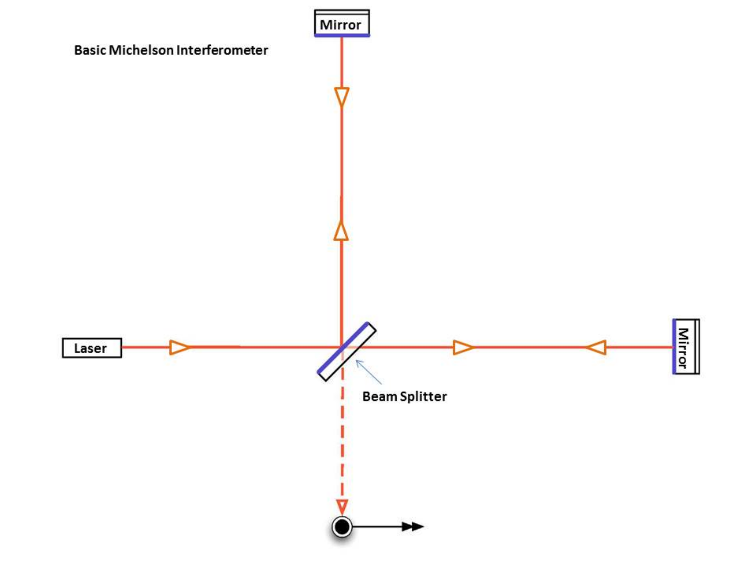
Require relative precision: 10^{-18}

Arm length $= 4$ km $\Rightarrow \Delta L = 4 \times 10^{-15}$m $\sim$ proton size



Michaelson Interferometer

Long distance: bigger phase due to gravitational waves Large power: reducing phase uncertainty; but bigger radiation noise.



Noise Reduction with Squeezed Lights
